RGlass, J.I.; Lefkowitz, E.J.; Glass, J.S.; Heiner, C.R.; Chen, E.Y.; Cassell, G.H. submitted to GenBank, February 2000
A. Description: The complete sequence of Ureaplasma urealyticum: Alternate views of a min A. Reference number: A82870
A. Accession: B82893
A. Status: preliminary
A. Molecule type: DNA
A. Residues: 1-91 - GLA>
A. Residues:

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     523
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Clone distribution: MGC clone distribution information can be four through the I.M.A.G.E. Consortium/LLNL at: http://image.llnl.gov Series: IRAK Plate: 31 Row: k Column: 15
This clone was selected for full length sequencing because it passed the following selection criteria: Hexamer frequency ORF analysis, GenomeScan gene prediction, Similarity but not identity
                                                                   Euteleostomi;
Murinae; Mus
                                                                                                           1 (bases 1 to 2616)

The RPCI-11 human BAC library was made from the blood of one male donor, as described by Oscegawa, K., Woon, P. Y., Zhaob, B., Frengen, E., Tateno, M., Catanese, J. J. and de Jong, P. J. (1998) An improved approach for construction of bacterial artificial chromosome libraries. Genomics 51:1-8. The clone may be obtained either from Research Genetics, Inc. (http://www.resgen.com) or Pieter de Jong and coworkers at the Roswell Park Cancer Institute
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Louis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.
                                                                                                                                                                                                                                                                                                                                   clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A PCR only region exists between bases 64163 to 64357. A transposon exists in this clone that has been deleted from the finished sequence. This transposon would insert after base 38173. Location/Qualifiers

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               * consists of 6 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submittor.

* This sequence will be replaced by the finished sequence as soon as it is available and the accession number will be preserved.

* 81376 81475: gap of 100 pp

* 81476 99350: contig of 17875 bp in length
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       344 AATCIGCAAAGATACTGGGGAGAGATACCAATATCATCAAGCCAGACCAACAGAAGTTCC

NOTE: This is a "working draft' sequence. It currently consists of 59 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will
                                                                                                                     Center project name: GZSG

NOTE: This is a 'working draft' sequence. It currently consists of 68 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Submitted (24-AUG-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA On Aug 14, 2002 this sequence version replaced gi:21735321.

                                                                                                        -i-FUNCTION: PERFORMS HIGHLY COMPLEX ORCHESTRATED TASKS DURING THE ASSEMBLY, BUDDING, MATURATION, AND INFECTION STAGES OF THE VIRAL REPLICATION CYCLE. DURING VIRAL ASSEMBLY, THE PROPEINS FORM MEMBRANE ASSCOLATIONS THAT ULTIMATELY RESULT IN BUDDING OF AN IMMATURE VIRION FROM THE INFECTED CELL. GAG PRECURSORS ALSO FUNCTION DURING VIRAL ASSEMBLY TO SELECTIVELY BIND AND PACKAGE TWO PLUS STRANDS OF GENOMIC RNA.

"Characterization and functional expression in Escherichia coli of the sodium/proton/glutamate symport proteins of Bacillus stearothermophilus and Bacillus caldotenax.";

Mol. Microbiol. 6:2845-2856(1992).

-! FUNCTION: THIS CARRIER PROTEIN IS PARF OF THE NA(+)-DEPENDENT, BINDING-PROTEIN-INDEPENDENT GLUTAMATE-ASPRATATE TRANSPORT SYSTEM.
-! SUBCELLULAR LOCATION: Integral membrane protein.
-! SUBLIARITY: BELONGS TO THE SODIUM:DICARBOXXLATE SYMPORTER FAMILY
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

T "Structure and activity of a new form of the glutamate transporter of the nematode Caenorhabditis elegans.";

Biosci. Biotechnol. Biochem. 61:927-929(1997).

- I- FUNCTION: TRANSPORTS L-GLITAMATE AND ALSO L- AND D-ASPARTATE.

ESSENTIAL FOR TERMINATING THE POSTSYNAPTIC ACTION OF GLUTAMATE BY RAPIDLY REMOVING RELEASED GLUTAMATE FROM THE SYNAPTIC CLEFT. ACTS

AS A SYMPORT BY CO-TRANSPORTING SODIUM (BY SIMILARITY).

- SUBCELLULAR LOCATION: Integral membrane protein.

- ALTERNATIVE PRODUCES 2 ISOFORMS; GLT-1 AND GLT-2 (SHOWN HERE);

ARE PRODUCED BY ALTERNATIVE SPLICING.

- SIMILARITY: BELONGS TO THE SODIUM:DICARBOXYLATE SYMPORTER FAMILY

FEBS Lett. 416:312-316(1997).
C. I- FUNCTION: TRANSPORTS L-GLUTAMATE AND ALSO L- AND D-ASPARTATE.
ESSENTIAL FOR TERMINATING THE POSTSYNAPTIC ACTION OF GLUTAMATE BY
RAPIDLY REMOVING RELEASED GLUTAMATE FROM THE SYNAPTIC CLEFT. ACTS
C. I- SUBCELLULAR LOCATION: Integral membrane protein.
C. I- ALTERNATIVE PRODUCTS: 3 ISOFORMS; GLT-1 (SHOWN HERE), GLT-1A
AND GLT-1B; ARE PRODUCED BY ALTERNATIVE SPLICING.
C. I- TISSUE SPECIFICITY: ISOFORM GLT1 IS EXPRESSED IN THE BRAIN.
C. I- FTM: GLYCOSYLATED.

C. PUNCTION: TRANSPORTS L-GLUTAMATE AND ALSO L- AND D-ASPARTATE.

ESSENTIAL FOR TERMINATING THE POSTSYNAPTIC CLEFT. ACTS
C. AS SYMPORT BY CO-TRANSPORTING SODIUM.

C. I- SUBCELLIDIAR LOCATION: Integral membrane protein.

C. I- ALTERNATIVE PRODUCTS: 2 ISOPRAMS; GLT1 (SHOWN HERE) AND GLT-1A;
ARE PRODUCED BY ALTERNATIVE SPLICING.

C. I- ALTERNATIVE SPLICITY: LOCALIZED IN BRAIN AND IS HIGHLY ENRICHED IN
THE PURKINJE CELL LAYER IN CEREBELLUM.

C. I- PTW. GLYCOSYLATED.

C. I- PTW. GLYCOSYLATED.

SIMILARITY: BLONGS TO THE SODIUM:DICARBOXYLATE SYMPORTER FAMILY
                                                                                                                                                                                                                                                                                                                                                    "The rat hepatoma cell line H4-II-E-C3 expresses high activities of
the high-affinity glutamate transporter GLT-IA.";
